**VFD Driver/Controller IC**

---

**PT6315**

---

## **DESCRIPTION**

PT6315 is a Vacuum Fluorescent Display (VFD) Controller driven on a 1/4 to 1/12 duty factor. Sixteen segment output lines, 4 grid output lines, 8 segment/grid output drive lines, one display memory, control circuit, key scan circuit are all incorporated into a single chip to build a highly reliable peripheral device for a single chip micro computer. Serial data is fed to PT6315 via a three-line serial interface. It is housed in a 44-pin, SSOP and LQFP Package.

## **FEATURES**

- CMOS Technology
- Low Power Consumption
- Key Scanning (16 x 2 matrix)
- Multiple Display Modes: (16 segments, 12 digits to 24 segments, 4 digits)
- 8-Step Dimming Circuitry
- LED Ports Provided (4 channels, 20 mA max.)
- Serial Interface for Clock, Data Input, Data Output, Strobe Pins
- No External Resistors Needed for Driver Outputs
- Available in 44-pin, SSOP and LQFP Package

## **APPLICATION**

- Microcomputer Peripheral Device

**PIN DESCRIPTION**

Pin Name	I/O	Description	Pin No.
LED1 to LED4	O	LED Output Pin	1 to 4
OSC	I	Oscillator Input Pin A resistor is connected to this pin to determine the oscillation frequency	5
DOUT	O	Data Output Pin (N-Channel, Open-Drain) This pin outputs serial data at the falling edge of the shift clock (starting from the lower bit).	6
DIN (Schmitt Trigger)	I	Data Input Pin This pin inputs serial data at the rising edge of the shift clock (starting from the lower bit)	7
CLK (Schmitt Trigger)	I	Clock Input Pin This pin reads serial data at the rising edge and outputs data at the falling edge.	8
STB (Schmitt Trigger)	I	Serial Interface Strobe Pin The data input after the STB has fallen is processed as a command. When this pin is "HIGH", CLK is ignored.	9
K1 to K2	I	Key Data Input Pins The data inputted to these pins are latched at the end of the display cycle.	10 ,11
VSS	-	Logic Ground Pin	12,44
VDD	-	Logic Power Supply	13,43
SG1/KS1 to SG16/KS16	O	High-Voltage Segment Output Pins Also acts as the Key Source	14 to 29
VEE	-	Pull-Down Level	30
SG17/GR12 to SG24/GR5	O	High Voltage Segment/Grid Output Pins	31 to 38
GR4 to GR1	O	High-Voltage Grid Output Pins	39 to 42

## FUNCTIONAL DESCRIPTION

### Commands

Commands determine the display mode and status of PT6315. A command is the first byte (b0 to b7) inputted to PT6315 via the DIN Pin after STB Pin has changed from “HIGH” to “LOW” State. If for some reason the STB Pin is set to “HIGH” while data or commands are being transmitted, the serial communication is initialized, and the data/commands being transmitted are considered invalid.

#### COMMAND 1: DISPLAY MODE SETTING COMMANDS

PT6315 provides 8 display mode settings as shown in the diagram below: As stated earlier a command is the first one byte (b0 to b7) transmitted to PT6315 via the DIN Pin when STB is “LOW”. However, for these commands, the bits 5 to 6 (b4 to b5) are ignored, bits 7 & 8 (b6 to b7) are given a value of “0”.

The Display Mode Setting Commands determine the number of segments and grids to be used (1/4 to 1/12 duty, 16 to 24 segments). When these commands are executed, the display is forcibly turned off, the key scanning stops. A display command “ON” must be executed in order to resume display. If the same mode setting is selected, no command execution is take place, therefore, nothing happens.

When Power is turned “ON”, the 12-digit , 16-segment modes is selected.

*Figure 3: Display Mode Settings*

## VFD Driver/Controller IC

## PT6315

### *Display Mode and RAM Address*

Data transmitted from an external device to PT6315 via the serial interface are stored in the Display RAM and are assigned addresses. The RAM Addresses of PT6315 are given below in 8 bits unit.

SG1      SG4 SG5      SG8 SG9    SG12 SG13    SG16 SG17    SG20 SG21      SG24

0 0 H <sub>L</sub>	0 0 H <sub>U</sub>	0 1 H <sub>L</sub>	0 1 H <sub>U</sub>	0 2 H <sub>L</sub>	0 2 H <sub>U</sub>	DIG1
0 3 H <sub>L</sub>	0 3 H <sub>U</sub>	0 4 H <sub>L</sub>	0 4 H <sub>U</sub>	0 5 H <sub>L</sub>	0 5 H <sub>U</sub>	DIG2

## COMMAND 2: DATA SETTING COMMANDS

The Data Setting Commands executes the Data Write or Data Read Modes for PT6315. The data Setting Command, the bits 5 and 6 (b4, b5) are ignored, bit 7 (b6) is given the value of "1" while bit 8 (b7) is given the value of "0". Please refer to the diagram below.

When power is turned ON, the bit 4 to bit 1 (b3 to b0) are given the value of "0".

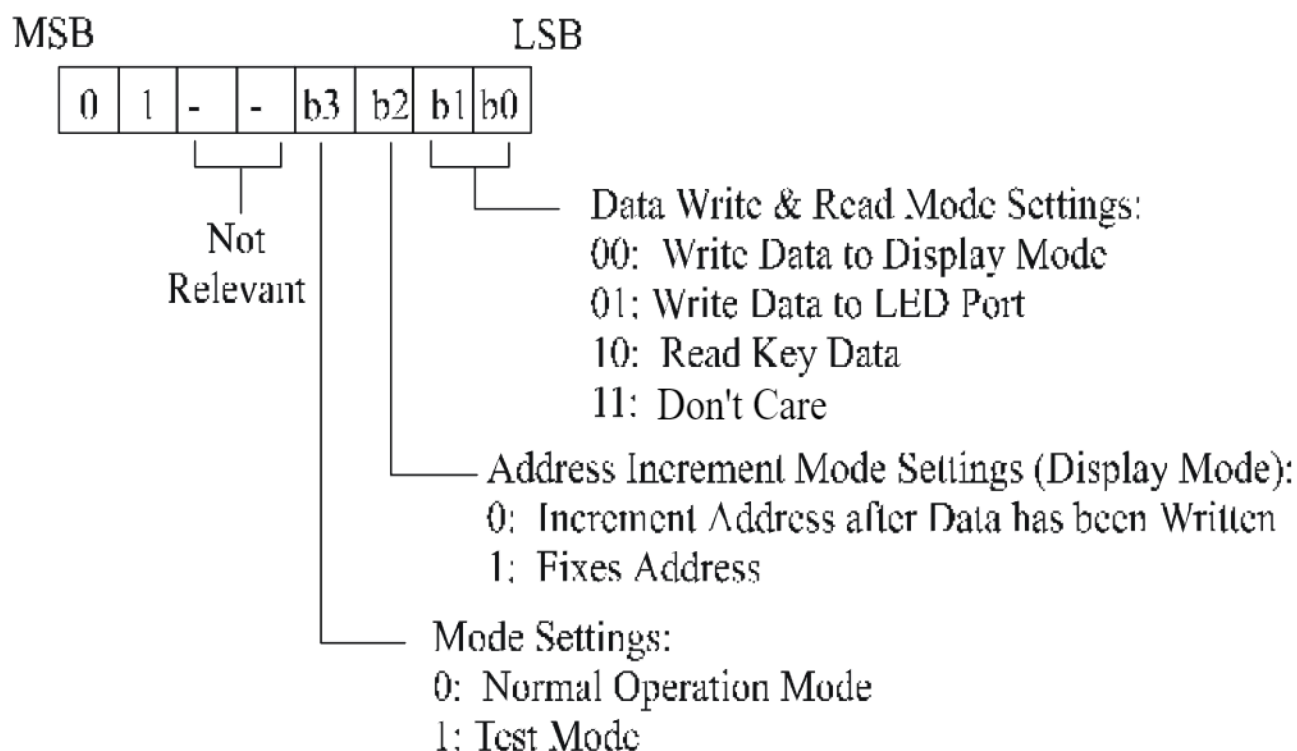

Figure 5: Data Settings

## VFD Driver/Controller IC

## PT6315

### PT6315 Key Matrix & Key Input Data Storage RAM

PT6315 Key Matrix consists of 16 x 2 array as shown below:

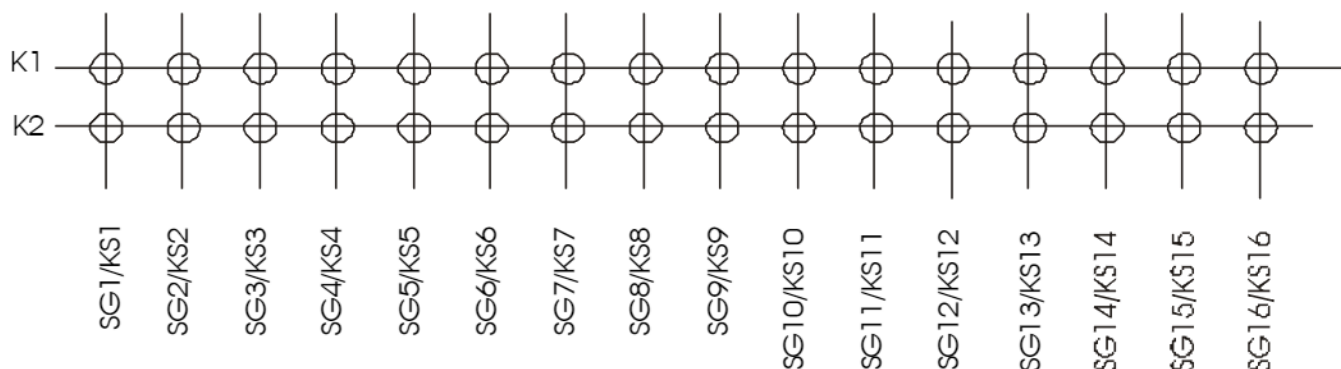

Figure 6: PT6315 Key Matrix

Each data inputted by each key are stored as follows. They are read by a READ Command, starting from the last significant bit. When the most significant bit of the data (SG1, b0) has been read, the least significant bit of the next data (SG16, b7) is read.

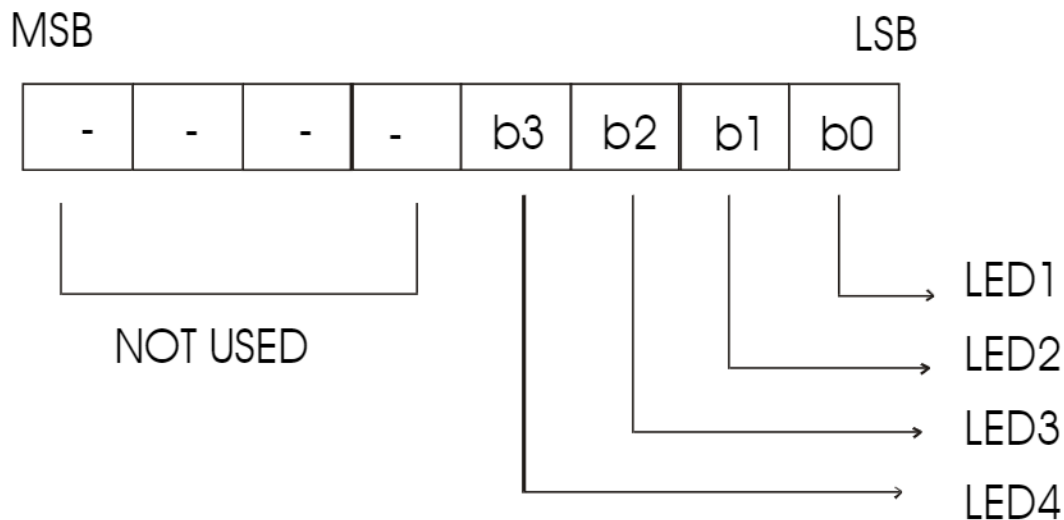

Figure 7: PT6315 Key Input Data Storage

### *LED Display*

PT6315 provides 4 LED Display Terminals, namely LED1 to LED4. Data is written to the LED Port starting from the least significant bit (b0) of the port using a WRITE Command. Each bit starting from the least significant (b0) activates a specific LED Display Terminal -- b0 corresponds LED1 Display, b1 activates LED2 and so forth. Since there are only 4 LED display terminals, bits 5 to 8 (b4 ~ b7) are not used and therefore ignored. This means that b4 to b7 does NOT in anyway activate any LED Display, they are totally ignored.

When a bit (b0 ~ b3) in the LED Port is "1", the corresponding LED is OFF. Conversely, when the bit is "0", the LED Display is turned ON. For example, Bit 1 (as designated by b0) has the value of "1", then this means that LED1 is OFF. **It must be noted that when power is turned ON, bit 1 to bit 4 (b0 to b3) are given the value of "0" (all LEDs are turned ON).** Please refer to the diagrams below.

*Figure 8: PT6315 LED Display Designation*

### COMMAND 3: ADDRESS SETTING COMMANDS

Address Setting Commands are used to set the address of the display memory. The address is considered valid if it has a value of “00H” to “23H”. If the address is set to 24H or higher, the data is ignored until a valid address is set. When power is turned ON, the address is set at “00H”.

Please refer to the diagram below.

Address: 00H to 23H

*Figure 10: Address Settings*

#### COMMAND 4: DISPLAY CONTROL COMMANDS

The Display Control Commands are used to turn ON or OFF a display. It also used to set the pulse width. Please refer to the diagram below. When the power is turned ON, a 1/16 pulse width is selected and the displayed is turned OFF (the key scanning is stopped).

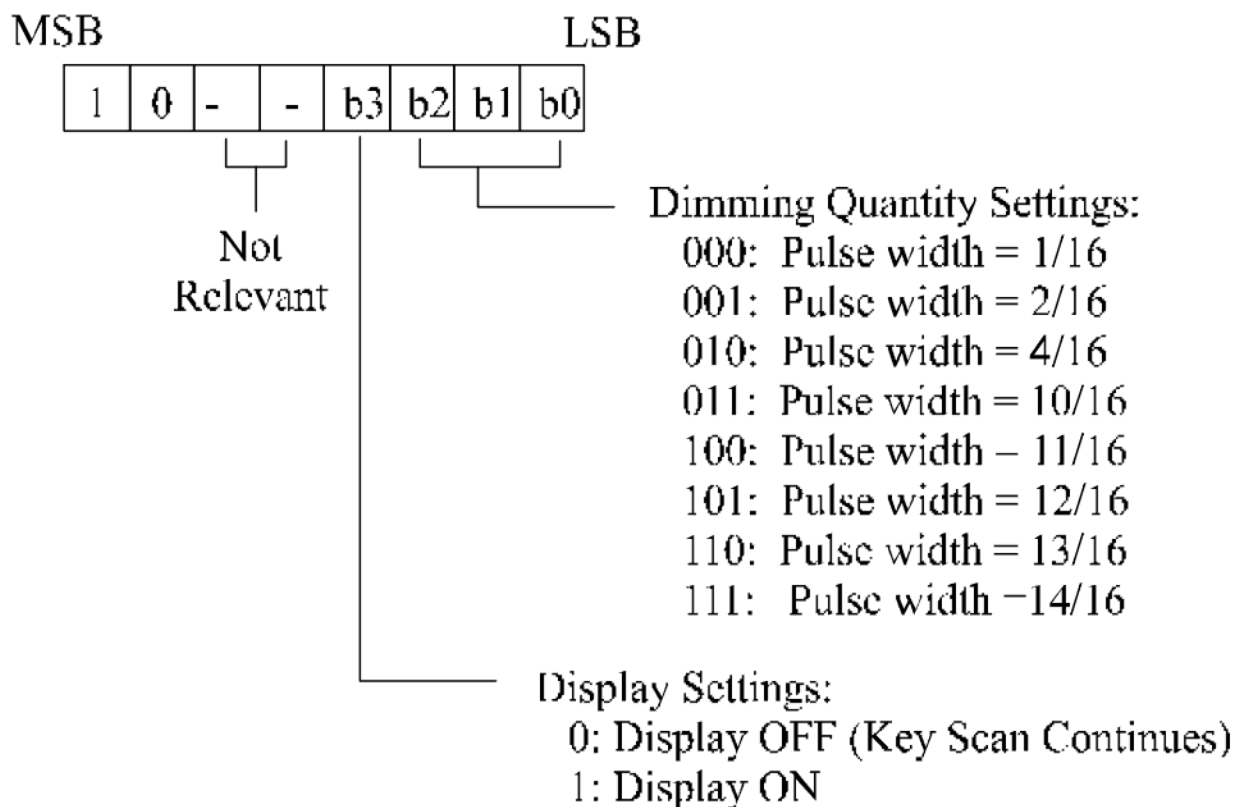

Figure 11: Display Control Settings

## SCANNING AND DISPLAY TIMING

The Key Scanning and display timing diagram is given below. One cycle of key scanning consists of 2 frames. The data of the 16 x 2 matrix is stored in the RAM.

Internal Operating Frequency ( $f_{osc}$ ) =  $224/T$

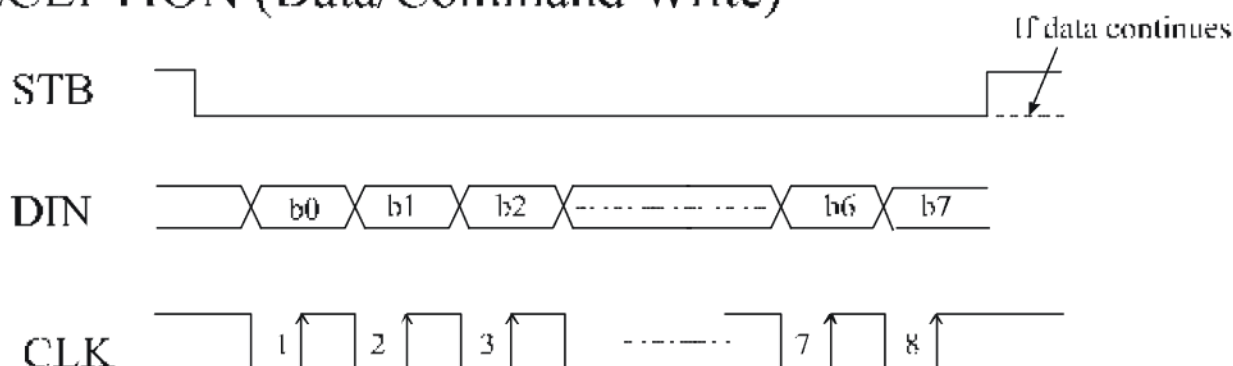

Figure 12: PT6315 Scanning & Display Timing Diagram

Note:  $T$  is the width of Segment only

## SERIAL COMMUNICATION FORMAT

The following diagram shows the PT6315 serial communication format. The DOUT Pin is an N-channel, open-drain output pin, therefore, it is highly recommended that an external pull-up resistor (1 KOhms to 10 KOhms) must be connected to DOUT.

### RECEPTION (Data/Command Write)

### TRANSMISSION (Data Read)

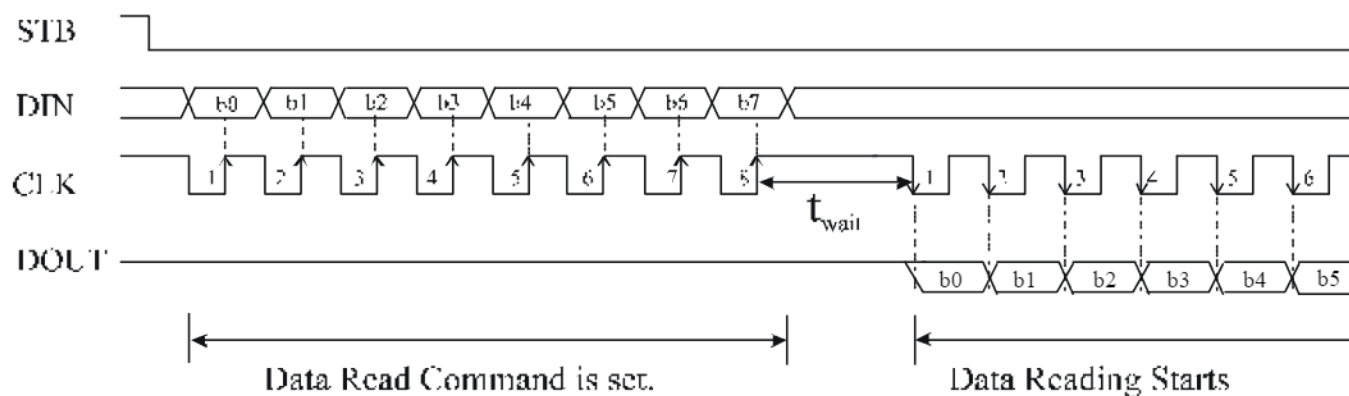

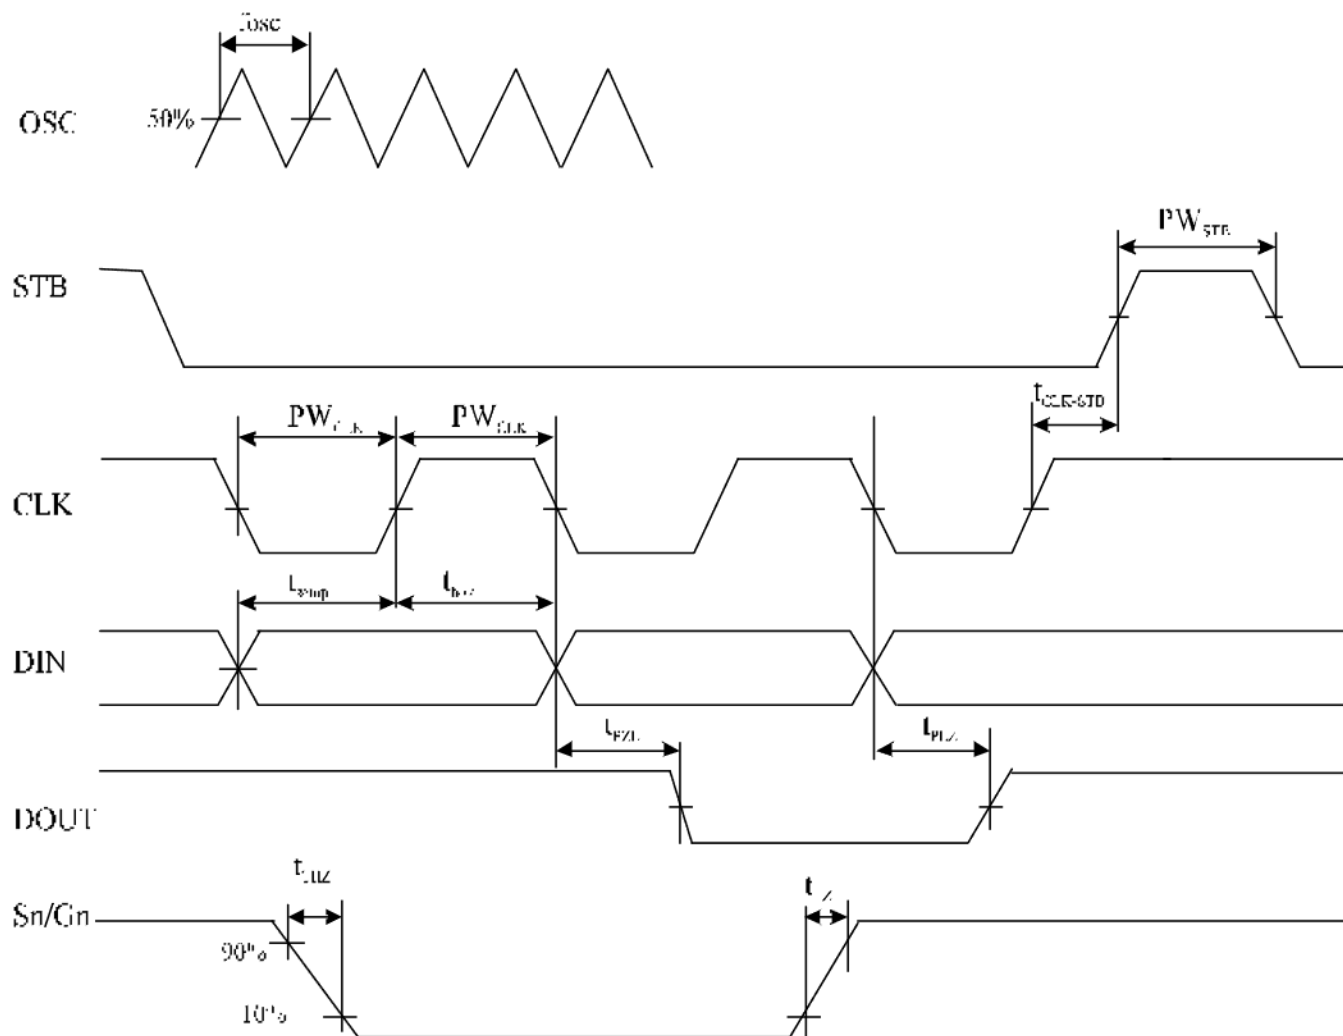

Figure 13: PT6315 Serial Communication Format

where:  $t_{wait}$  (waiting time)  $\geq 1\mu s$

It must be noted that when the data is read, the waiting time ( $t_{wait}$ ) between the rising of the eighth clock that has set the command and the falling of the first clock that has read the data is greater or equal to  $1\mu s$ .

## SWITCHING CHARACTERISTIC WAVEFORM

PT6315 Switching Characteristics Waveform is given below.

where:  $PW_{CLK}$  (Clock Pulse Width)  $\geq 400ns$   
 $t_{setup}$  (Data Setup Time)  $\geq 100ns$   
 $t_{CLK-STB}$  (Clock - Strobe Time)  $\geq 1\mu s$   
 $t_{THZ}$  (Grid Rise Time)  $\leq 0.5\mu s$  (at  $VDD=5V$ )  
 $t_{THZ}$  (Grid Rise Time)  $\leq 1.0\mu s$  (at  $VDD=3.3V$ )  
 $t_{THZ}$  (Segment Rise Time)  $\leq 2.0\mu s$  (at  $VDD=5V$ )  
 $t_{THZ}$  (Segment Rise Time)  $\leq 3.0\mu s$  (at  $VDD=3.3V$ )

$PW_{STB}$  (Strobe Pulse Width)  $\geq 1\mu s$   
 $t_{hold}$  (Data Hold Time)  $\geq 100ns$   
 $t_{THZ}$  (Fall Time)  $\leq 150\mu s$   
 $t_{PZL}$  (Propagation Delay Time)  $\leq 100ns$   
 $t_{PLZ}$  (Propagation Delay Time)  $\leq 400ns$   
 $f_{osc}$  = Oscillation Frequency

Figure 14: PT6315 Switching Characteristic Waveform

## APPLICATIONS

Display memory are updated by incrementing addresses. Please refer to the following diagram.

where: Command 1: Display Mode Setting Command  
 Command 2: Data Setting Command  
 Command 3: Address Setting Command  
 Data 1 to n : Transfer Display Data (36 Bytes max.)  
 Command 4: Display Control Command

*Figure 15: Display Memory Updated by Address Increments*

The following diagram shows the waveforms when updating specific addresses.

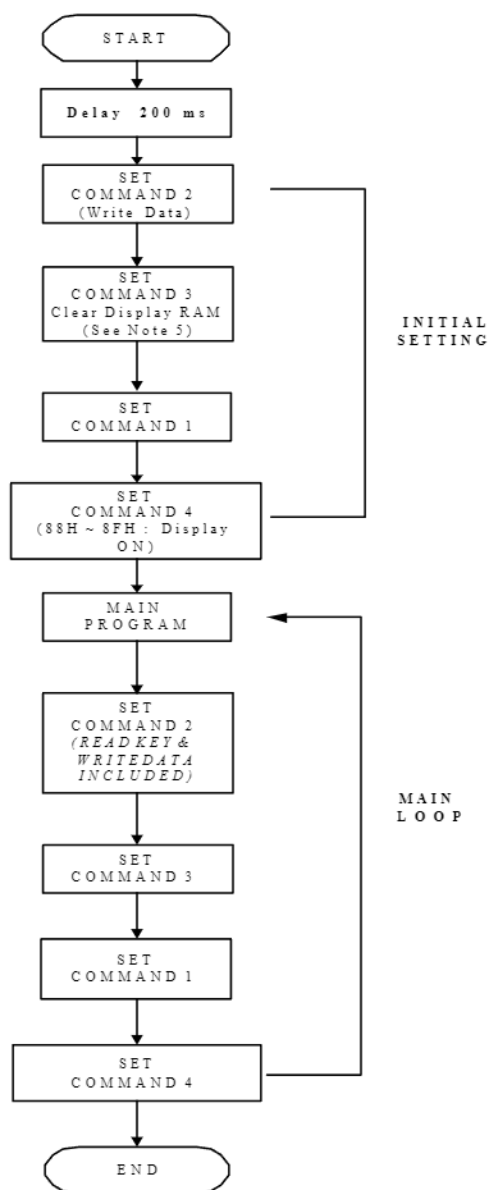

where: Command 2 -- Data Setting Command  
 Command 3 -- Address Setting Command  
 Data -- Display Data

*Figure 16: Address Update*

## RECOMMENDED SOFTWARE FLOWCHART

- Note:
1. Command 1: Display Mode Commands
  2. Command 2: Data Setting Commands
  3. Command 3 : Address Setting Commands
  4. Command 4: Display Control Commands
  5. When IC power is applied for the first time, the contents of the Display RAM are not defined; thus, it is strongly suggested that the contents of the Display RAM must be cleared during the initial setting.

## Notes:

1. Controlling Dimensions are in millimeters .
2. Dimensioning and tolerancing per ASME Y14.5M-1994.
3. The top package body size may be smaller than the bottom package size by as much as 0.15mm.
4. Datums A-B and D to be determined at datum plane H.
5. Dimensions D1 and E1 do not include mold protrusion. Allowable protrusion is 0.25 mm per side. D1 and E1 are maximum plastic body size dimensions including mold mismatch.
6. Details of pin1 identifier are optional but must be located within the zone indicated.
7. Dimension b does not include dambar protrusion. Allowable dambar protrusion shall not cause the lead to exceed the maximum b dimension by more than 0.08mm. Dambar cannot be located on the lower radius or the foot. Minimum space between protrusion and an adjacent lead is 0.07mm for 0.4mm and 0.5mm pitch packages.
8. A1 is defined as the distance from the seating plane to the lowest point on the package body.
9. Refer to JEDEC STD MS-026 Variation BCB

JEDEC is the trademark of JEDEC SOLID STATE TECHNOLOGY ASSOCIATION
